Project Report: [Project title]

Team: [Names]
Route: [A: develop something new / B: Kaggle / C: build a dataset]
Repository: [Link to your repository README]

Replace the prompts with your team's account of the project. Use paragraphs, figures, tables, and links where they help. You may rename or combine sections. The report should be long enough to fully describe your work; there is no page or word limit.

Why we chose this project

[What question interested your team? Why did it matter to you? What did you hope to learn or accomplish?]

What we planned and what we did

[Describe the main steps of the project in an order a reader can follow. What data did you obtain or create? What ML method or pipeline did you build and try? Explain the important choices and link to the relevant code, dataset documentation, or figures. For route A, describe the team-designed component; for B, describe both pipelines, the design change and its reason, and which submission each produced; for C, describe the dataset construction and quality checks.]

Challenges and decisions along the way

[Describe the most important difficulties, surprises, or tradeoffs. What did you try in response? Did the question, scope, data, or method change? Explain why and what you learned from attempts that did not work.]

Final outcomes

[What did you find or produce? Give the main results with links to supporting figures, tables, examples, or saved outputs. For route B, compare the local validation and Kaggle results for both submissions and discuss whether the design change improved or degraded performance. Explain what the

evidence supports, what remains uncertain, and any important failures or limitations. A negative or mixed result is welcome when you explain it carefully.]

What we learned and would do next

[What did this project teach your team about the topic, the data, or ML practice? If you had more time, what would you investigate or improve next?]

Reproduction, contributions, and sources

[Point readers to the repository README's setup and run instructions. Briefly describe each teammate's contributions. Credit datasets, code, papers, pretrained models, and material AI assistance that shaped the project.]
